

Junior front-end developer

Technical test

Create a single page application using a framework of your choice. This is an application meant for ordering pizza online, through a multistep process.

In the first step the user chooses the dough type: for example thin or thick.

In the second step the user chooses the ingredients. The application will show a list of ingredients and the user will tick the ones he/she wants. Each ingredient costs Euro 0.50.

In the last step the user reviews his/her choice and submits the order.

Guidelines

- You don't need to create the backend side. For this test only the frontend side will be assessed.
- You should implement a single-page-application.
- We do not require you to handle user authentication.
- The application shall fetch the list of dough types and ingredients from remote APIs. You should mock them with functions similar to this one:

```
var fetchDoughTypes = function () {  
  return [  
    {  
      id: 1,  
      name: 'Thin',  
      description: 'Thin and crusty pizza dough'  
    },  
    {  
      id: 2,  
      name: 'Thick',  
      description: 'Thick and soft pizza dough'  
    }  
  ];  
};
```

Extras

- Unit tests.
- The application has a router component.
- Nice UI and UX.

Remember, the most important things for us are:

- code readability
- code reusability
- code maintainability.

Good luck!
